1  ; *****
2  ; RETRODOS.SYS (PCDOS 7.1 Kernel) - RETRO DOS v5.0 by ERDOGAN TAN - 12/09/2023
3  ; -----
4  ; Last Update: 29/01/2026 - Retro DOS v5.0 (Modified PCDOS 7.1)
5  ; -----
6  ; Beginning: 26/12/2018 (Retro DOS 4.0), 01/10/2022 (Retro DOS 4.2)
7  ; -----
8  ; Assembler: NASM version 2.15
9  ; -----
10 ; ((nasm retrodos5.s -l retrodos5.txt -o PCDOS.SYS -Z error.txt))
11 ; -----
12 ; Included binary file: IBMDOS7.BIN (Retro DOS 5.0 - PCDOS 7.1 IBMDOS.COM)
13 ; *****
14
15 ; 12/09/2023 - Retro DOS v5.0 Kernel -dosbios- ('ibmbio7.s')
16 ; Modified from 'iosys6.s' (11/09/2023, Retro DOS v4.2 Kernel's IO.SYS) file
17 ; as below:
18 ;
19 ; 1) Retro DOS v4.2 IO.SYS is based on disassembled source code
20 ; of MSDOS 6.21 IO.SYS, derived using MSDOS 6.0 source code.
21 ;
22 ; 2) Labels, names, comments, explanations and structure definitions
23 ; about procedures and code details are almost entirely taken from
24 ; the original MSDOS 6.0 source code, except for the details that
25 ; Erdogan Tan personally experienced. Some of them are incompatible
26 ; with PCDOS 7.1 code. But they have not been deleted to preserve
27 ; the originality of the descriptions.)
28 ;
29 ; 3) 'ibmbio7.s' contains the BIOSLOADER (MSLOADER) section located in
30 ; the 1st 4 sectors of the IBMBIO.COM file on disk. This is a method
31 ; from older DOS versions (3 sectors for MSDOS 6.22).
32 ; The MSDOS/PCDOS boot sector code only reads these MSLOADER/BIOSLOADER
33 ; sectors and transfers control to the MSLOADER/BIOSLOADER code.
34 ; BUT!!! The Retro DOS v3 (& v5) boot sector code loads the entire
35 ; MSDOS.SYS/PCDOS.SYS -combined- kernel file into memory at once.
36 ; So, hence the Retro DOS boot sector code, 'retrodos5.s' file
37 ; contains slightly different IO.SYS/IBMBIO.COM Initialization code
38 ; than the original PCDOS/MSDOS. It does not include
39 ; the MSLOADER/BIOSLOADER section. The 'retrodos5.s' and 'ibmbio7.s'
40 ; files are almost identical except their INIT codes.)
41 ;
42 ; ('iosys6.s' has been converted to 'ibmbio7.s' and 'retrodos42.s' has been
43 ; converted to 'retrodos5.s'. 'ibmbio7.s' is IBMBIO.COM source code file
44 ; while 'retrodos5.s' is source code of Retro DOS v5 kernel file 'PCDOS.SYS'.
45 ; 'retrodos5.s' includes 'ibmdos7.bin' or IBMDOS.COM as binary file.)
46 ;
47 ; -----
48 ;
49 ; 20/12/2022 - Modifications for initiating IO.SYS by Retro DOS v2 boot sector
50 ;
51 ; (Retro DOS v2 BS loads IO.SYS & MSDOS.SYS as single kernel file
52 ; with name of 'MSDOS.SYS'. Retro DOS init code -for IO.SYS init-
53 ; is different than original MSDOS IO.SYS LOADER and INIT code.)
54 ;
55 ; ((RETRODOS.SYS/MSDOS.SYS can be loaded by a fake IO.SYS for
56 ; using it with MSDOS 5.0 boot sector & as bootable MSDOS disk.
57 ; For that, fake IO.SYS must load 'MSDOS.SYS' at 1000h:0000h.))
58 ;
59 ; 18/12/2022 - Modified MSDOS 5.0 IO.SYS (for using with MSDOS 5 boot sector)
60 ; 09/12/2022 - Multisection binary file format (BIOSDATA & BIOSCODE sections)
61 ; 01/10/2022 - Erdogan Tan (Istanbul)
62 ;
63 ; Note: This code is a part of Retro DOS 4.0 kernel source code
64 ; (as included binary, 'IOSYS5.BIN')
65 ; Equivalent of MSDOS 5.0 IO.SYS, BIOSCODE and BIOSDATA and SYSINIT
66 ; (except MSLOAD code)
67 ;
68 ; -----
69 ; Retro DOS v2 (v3) boot sector loads RETRODOS.SYS (MSDOS.SYS)
70 ; at 1000h:0000h and loader (initialization) part of RETRODOS kernel
71 ; moves IO.SYS (DOSBIOSCODE & DOSBIOSDATA, 'IOSYS5.BIN') to 70h:0000h.
72 ; Then SYSINIT code to the next segment (46Dh for original MSDOS 5.0)..
73 ; SYSINIT code relocates itself and DOSBIOSCODE and MSDOS.SYS
74 ; (MSDOS5.BIN) according to request/setting in 'config.sys' file.
75 ; -----
76 ;
77 ; =====
78 ; Modified from 'retrodos3.s', Retro DOS v3.0 Kernel (IBMBIO.COM) Source code
79 ; by Erdogan Tan, 10/09/2018

170 ;
171 ; BDS is the Bios Data Structure.
172 ;
173 ; There is one BDS for each logical drive in the system. All the BDS's
174 ; are linked together in a list with the pointer to the first BDS being
175 ; found in START_BDS. The BDS hold various values important to the disk
176 ; drive. For example there is a field for last time accesses. As actions
177 ; take place in the system the BDS are update to reflect the actions.
178 ; For example is there is a read to a disk the last access field for the
179 ; BDS for that drive is update to the current time.
180 ;
181 ; Values for various flags in BDS.flags.
182 ;
183
184 fnon_removable equ 01h ;For non-removable media
185 fchangeline equ 02h ;If changeline supported on drive
186 return_fake_bpb equ 04h ; When set, don't do a build BPB
187 ; just return the fake one
188 good_tracklayout equ 08h ; The track layout has no funny sectors
189 fi_am_mult equ 10h ; If more than one logical for this physical
190 fi_own_physical equ 20h ; Signify logical owner of this physical
191 fchanged equ 40h ; Indicates media changed

```

```

745 ; MSDOS 6.0 - BPB.INC - 1991
746 ; #####
747 ; ** BIOS PARAMETER BLOCK DEFINITION
748 ;
749 ; The BPB contains information about the disk structure. It dates
750 ; back to the earliest FAT systems and so FAT information is
751 ; intermingled with physical driver information.
752 ;
753 ; A boot sector contains a BPB for its device; for other disks
754 ; the driver creates a BPB. DOS keeps copies of some of this
755 ; information in the DPB.
756 ;
757 ; The BDS structure contains a BPB within it.

1255 ; (MSDOS 3.3) NOTE:
1256 ; Some floppy drives do not have changeline support. The result is a
1257 ; large amount of inefficiency in the code. A media-check always returns
1258 ; "I don't know". This cause DOS to reread the FAT on every access and
1259 ; always discard any cached data.
1260 ; We get around this inefficiency by implementing a "Logical Door Latch".
1261 ; The following three items are used to do this. The logical door latch is
1262 ; based on the premise that it is not physically possible to change floppy
1263 ; disks in a drive in under two seconds (most people take about 10). The
1264 ; logical door latch is implemented by saving the time of the last successful
1265 ; disk operation (in the value TIM_DRV). When a new request is made the
1266 ; current time is compared to the saved time. If less than two seconds have
1267 ; passed then the value "No Change" is returned. If more than two seconds
1268 ; have passed the value "Don't Know" is returned.
1269 ; There is one complication to this algorithm. Some programs change the
1270 ; value of the timer. In this unfortunate case we have an invalid timer.
1271 ; This possibility is detected by counting the number of disk operations
1272 ; which occur without any time passing. If this count exceeds the value of
1273 ; "AccessMax" we assume the counter is invalid and always return "Don't
1274 ; know". The variable "AccessCount" is used to keep track of the number
1275 ; of disk operation which occur without the time changing.
1276

1287
1288 ; (MSDOS 3.3) NOTE:
1289 ; Some of the older versions of the IBM rom-bios always assumed a seek would
1290 ; have to be made to read the diskette. Consequently a large head settle
1291 ; time was always used in the I/O operations. To get around this problem
1292 ; we need to continually adjust the head settle time. The following
1293 ; algorithm is used:
1294 ;
1295 ;   Get the current head settle value.
1296 ;   If it is 1, then
1297 ;     set slow = 15
1298 ;   else
1299 ;     set slow = value
1300 ;   ...
1301 ;   if we are seeking and writing then
1302 ;     use slow
1303 ;   else
1304 ;     use fast
1305 ;   ...

5144
5145 ;-----
5146 ;
5147 ; System initialization
5148 ;
5149 ; The entry conditions are established by the bootstrap
5150 ; loader and are considered unknown. The following jobs
5151 ; will be performed by this module:
5152 ;
5153 ; 1. All device initialization is performed
5154 ; 2. A local stack is set up and DS:SI are set
5155 ; to point to an initialization table. Then
5156 ; an inter-segment call is made to the first
5157 ; byte of the dos
5158 ; 3. Once the dos returns from this call the ds
5159 ; register has been set up to point to the start
5160 ; of free memory. The initialization will then
5161 ; load the command program into this area
5162 ; beginning at 100 hex and transfer control to
5163 ; this program.
5164 ;
5165 ;-----
5166
5167 ; 20/12/2022
5168 ;-----
5169 ; Registers
5170 ;-----
5171 ; DL = [bsDriveNumber]
5172 ; DH = [bsMedia]
5173 ; DS = 0, ES = 0, SS = 0
5174 ; BP = 7C00h
5175 ; SP = 700h
5176 ;-----
5177 ; CX = 0
5178
5179 ; 02/10/2022 - 20/12/2022
5180 ;-----
5181 ; Note: Retro DOS v4.0 Kernel does not use/contain MSLOAD part of IO.SYS (5.0)
5182 ; Because, Retro DOS v2 boot sector loads complete/entire MSDOS.SYS
5183 ; (RETRODOS.SYS) kernel file (IO.SYS & MSDOS.SYS together).
5184 ; As result of boot sector ve init differences, Retro DOS init code (here)
5185 ; moves kernel to segment 70h at first, then sets diskette parameters
5186 ; at segment 50h (while MSDOS 5.0 boot sector and then MSLOAD sets this).
5187 ;-----
5188
5189 ; msload will check the extended boot record and set ax, bx accordingly.
5190 ;
5191 ; msload passes a 32 bit sector number hi word in ax and low in bx
5192 ; save this in cs:bios_h and cs:bios_l. this is for the start of
5193 ; data sector of the bios.
5194 ;
5195 mov [cs:bios_h], ax ; (start of) dos bios (IO.SYS) data sector
5196 mov [cs:bios_l], bx
5197
5198 ; with the following information from msload, we don't need the
5199 ; boot sector any more.-> this will solve the problem of 29 kb size
5200 ; limitation of msbio.com file.

5305 ; we have to support a system that does not have any diskette
5306 ; drives but only hardfiles. this system will ip1 from the hardfile.
5307 ; if the equipment flag bit 0 is 1, then the system has diskette drive(s).
5308 ; otherwise, the system has only hardfiles.
5309
5310 ; important thing is that still, for compatibility reason, the drive letter
5311 ; for the hardfiles start from "c". so, we still need to allocate dummy bds
5312 ; drive a and drive b. at sysinit time, we are going to set cds table entry
5313 ; of dpb pointer for these drives to 0, so any user attempt to access this
5314 ; drives will get "invalid drive letter ..." message. we are going to
5315 ; establish "fakefloppydrv" flag. ***sysinit module should call int 11h to
5316 ; determine whether there are any diskette drivers in the system or not.!!!***
5317
5318 ; check the register returned by the equipment determination interrupt
5319 ; we have to handle the case of no diskettes in the system by faking
5320 ; two dummy drives.
5321 ;
5322 ; if the register indicates that we do have floppy drives we don't need
5323 ; to do anything special.
5324 ;
5325 ; if the register indicates that we don't have any floppy drives then
5326 ; what we need to do is set the fakefloppydrv variable, change the
5327 ; register to say that we do have floppy drives and then go to execute
5328 ; the code which starts at notsingle. this is because we can skip the
5329 ; code given below which tries to find if there are one or two drives
5330 ; since we already know about this.

7200
7201 ; *****
7202 ; module name: remap

```

```

7202 ;
7203 ; descriptive name: all the code for himem that could be separated from msbio
7204 ;
7205 ; function: remap the bds chain to adjusted logical drive numbers (drive
7206 ; letters) if more than two diskette drives on the system.
7207 ;
7208 ; scheme: if more than 2 diskette drives, first map the bds structure
7209 ; as usual and then rescan the bds chain to adjust the drive
7210 ; letters. to do this, scan for disk drives and assign logical
7211 ; drive number starting from 2 and then rescan diskette drives
7212 ; and assign next to the last logical drive number of last disk
7213 ; drive to the 3rd and 4th diskette drives.
7214 ;
7215 ; input: none
7216 ; exit: drive letters have been remapped in bds chain
7217 ; exit error: none
7218 ; called from: msinit
7219 ;
7220 ; notes: this function will be called only if more than 2 diskettes are
7221 ; found in the system
7222 ; this function assumes that there are no more than 26 drives assigned
7223 ; this is guaranteed by the code that creates bdss for partitions
7224 ; this function assumes that the first entries in the chain are
7225 ; floppy drives, and all the rest are hard drives
7226 ; will alter the boot drive if necessary to reflect remapping
7227 ;

8961
8962 ;fdisk of pc dos 3.3 and below, os2 1.0 has a bug. the maximum number of
8963 ;sector that can be handled by pc dos 3.3 ibmbio should be 0ffffh.
8964 ;instead, sometimes fdisk use 10000h to calculate the maximum number.
8965 ;so, we are going to check that if BPB_TOTALSECTORS + hidden sector = 10000h
8966 ;then subtract 1 from BPB_TOTALSECTORS.

9057 ; setdrvparms sets up the recommended bpb in each bds in the system based on
9058 ; the form factor. it is assumed that the bpbs for the various form factors
9059 ; are present in the bphtable. for hard files, the recommended bpb is the same
9060 ; as the bpb on the drive.
9061 ;
9062 ; no attempt is made to preserve registers since we are going to jump to

```

```

9062 ; sysinit straight after this routine.

9865 ; -----
9866 ; the following code is written by jack gulley in engineering group.
9867 ; cp dos (CP/DOS, OS/2) is changing cmos clock rate for its own purposes
9868 ; and if the use cold boot the system to use pc dos while running cp dos,
9869 ; the cmos clock rate are still slow which slow down disk operations
9870 ; of pc dos which uses cmos clock. pc dos is put this code in msinit
9871 ; to fix this problem at the request of cp dos.
9872 ;
9873 ; the program is modified to be run on msinit. equates are defined
9874 ; in cmosequ.inc. this program will be called by cmos_clock_read procedure.
9875 ;
9876 ; the following code cmosck is used to insure that the cmos has not
9877 ; had its rate controls left in an invalid state on older at's.
9878 ;
9879 ; it checks for an at model byte "fc" with a submodel type of
9880 ; 00, 01, 02, 03 or 06 and resets the periodic interrupt rate
9881 ; bits in case post has not done it. this initialization routine
9882 ; is only needed once when dos loads. it should be run as soon
9883 ; as possible to prevent slow diskette access.
9884 ;
9885 ; this code exposes one to dos clearing cmos setup done by a
9886 ; resident program that hides and re-boots the system.
9887 ;
9888 ;
9889 ;
9890 cmosck: ; check and reset rtc rate bits
9891 ; model byte and submodel byte were already determined in msinit.

; ===== S U B   R O U T I N E =====
; *****
; *
; * chrin - input single char from keyboard into al
; *
; *
; * we are going to issue extended keyboard function, if
; * supported. the returning value of the extended keystroke
; * of the extended keyboard function uses 0E0h in al
; * instead of 00h as in the conventional keyboard function.
; * this creates a conflict when the user entered real
; * greek alpha character (= 0E0h) to distinguish the extended
; * keystroke and the greek alpha. this case will be handled
; * in the following manner:
; *
; *      ah = 16h
; *      int 16h
; *      if al == 0, then extended code (in ah)
; *      else if al == 0E0h, then
; *      if ah < 0, then extended code (in ah)
; *      else greek_alpha character.
; *

12037 tim_read:          ; 2C7h:435h = 70h:29A5h
12038         call      GetTickCnt
12039         mov        si, [daycnt]
12040
12041 ; we now need to convert the time in tick to the time in 100th of
12042 ; seconds. the relation between tick and seconds is:
12043 ;
12044 ;         65,536 seconds
12045 ; -----
12046 ;        1,193,180 tick
12047 ;
12048 ; to get to 100th of second we need to multiply by 100. the equation is:
12049 ;
12050 ;        ticks from clock * 65,536 * 100
12051 ; ----- = time in 100th of seconds
12052 ;        1,193,180
12053 ;
12054 ; fortunately this formula simplifies to:
12055 ;
12056 ;        ticks from clock * 5 * 65,536
12057 ; ----- = time in 100th of seconds
12058 ;        59,659
12059 ;
12060 ; the calculation is done by first multiplying tick by 5. next we divide by
12061 ; 59,659. in this division we multiply by 65,536 by shifting the dividend
12062 ; my 16 bits to the left.
12063 ;

12625                        ; =====
12626                        ; Setptrsav is also jumped to from dsk_init (msbio2.asm). In both cases, the
12627                        ; pointer to be returned is in es:di. We were incorrectly returning ds:di.
12628                        ; Note that this works in most cases because most pointers are in Bios_Data.
12629                        ; It fails, for instance, when we install an external drive using driver.sys
12630                        ; because then the BDS segment is no longer Bios_Data.
12631                        ; NB: It is fine to corrupt cx because this is not a return value and anyway
12632                        ; this returns to Chardev_entry (msbio1.asm) where all registers are
12633                        ; restored before returning to the caller.
12634                        ; =====

12751 ;; ! NOTE - 11/08/2023 - Erdogan Tan (Retro DOS v4.2 IO.SYS bugfix)
12752 ; Microsoft/IBM code has a bug here because the BDS's
12753 ; .volid and .filesys_id fields will be reset
12754 ; (to their default text) according to 'BDS.fatsiz' flags
12755 ; at the BDS offset 59 but current (this) code checks flags
12756 ; at ES:DI+59 while DI points the BDS offset 136!? ; (PCDOS 7.1)
12757 ;; at the BDS offset 31 but current (this) code checks flags
12758 ;; at ES:DI+31 while DI points the BDS offset 86!? ; (MSDOS 6.22)
12759 ;
12760 ; Correct Code:
12761 ; ;test byte [ES:59],20h or [ES:BDS.fatsiz],fbigbig ; (PCDOS 7.1)
12762 ; ;test byte [ES:31],40h or [ES:BDS.fatsiz],fbig ; (MSDOS 6.22)
12763 ; 11/09/2023
12764 ; (before 'rep movsb') 'mov al,[es:di+BDS.Fatsiz]' and then
12765 ; (after 'rep movsb') 'test al,fbig' (AL is free/proper to use here)
12766 ;
12767 ; Same BUG is existing in MSDOS 6.22 IO.SYS - BIOSCODE:05EFh
12768 ; and in Windows ME IO.SYS - BIOSCODE:0E1Ah as 'test byte [es:di+59],20h'
12769 ;
12770 ; (why this bug did not affect MSDOS and PCDOS 7.x applications:
12771 ; 'clear_ids' is used for floppy disks only and the default
12772 ; option of 'clear_ids' is FAT12 volid and filesys_id text
12773 ; when the flag bit has wrong value for FAT16/40h or FAT32/20h.)

12819
12820 ; 15/10/2022
12821
12822 ; -----
12823 ; getbp - return bpb from the drive specified by the bds.
12824 ; if the return_fake_bpb flag is set, then it does nothing.
12825 ; note that we never come here for fixed disks.
12826 ; for all other cases,
12827 ; - it reads boot sector to pull out the bpb
12828 ; - if no valid bpb is found, it then reads the fat sector,
12829 ; to get the fat id byte to build the bpb from there.
12830
12831 ; inputs: es:di point to correct bds.
12832
12833 ; outputs: fills in bpb in current bds if valid bpb or fat id on disk.
12834 ; carry set, and al=7 if invalid disk.
12835 ; carry set and error code in al if other error.
12836 ; if failed to recognize the boot record, then will set the
12837 ; set_id_flag to 0.
12838 ; this routine will only work for a floppy diskette.
12839 ; for a fixed disk, it will just return.
12840
12841 ; ***** Note: getbp is a clone of getbp which uses the newer
12842 ; segment definitions. It should be migrated towards.
12843 ; now es:di has the bds, ds: has Bios_Data

13103 000007BC 31DB      xor     bx, bx ; assume valid boot sector
13104
13105      ; put a sanity check for the boot sector in here to detect
13106      ; boot sectors that do not have valid bpb. we examine the
13107      ; first two bytes - they must contain a long jump (69h) or a
13108      ; short jump (EBh) followed by a nop (90h), or a short jump
13109      ; (E9h). if this test is passed, we further check by examining
13110      ; the signature at the end of the boot sector for the word
13111      ; AA55h. if the signature is not present, we examine the media
13112      ; descriptor byte to see if it is valid. for dos 3.3, this
13113      ; logic is modified a little bit. we are not going to check
13114      ; signature. instead we are going to sanity check the media
13115      ; byte in bpb regardless of the validity of signature. this is
13116      ; to save the already developed commercial products that have
13117      ; good jump instruction and signature but with the false bpb
13118      ; informations

17641 ; move a 512 byte sector from ds:si to es:di, do not trash cx
17642 ; but go ahead and update direction flag, si, & di
17643 move_sector:
17644 ; The 80386 microprocessor considers an access to WORD 0FFFFh in
17645 ; any segment to be a fault. Theoretically, this could be handled
17646 ; by the fault handler and the behavior of an 8086 could be emulated
17647 ; by wrapping the high byte to offset 0000h. This would be a lot
17648 ; of work and was, indeed, blown off by the win386 guys. COMPAQ
17649 ; also handles the fault incorrectly in their ROM BIOS for real
17650 ; mode. Their fault handler was only designed to deal with one
17651 ; special case which occurred in a magazine benchmark, but didn't
17652 ; handle the general case worth beans.
17653 ;
17654 ; Simply changing this code to do a byte loop would work okay but
17655 ; would involve a general case performance hit. Therefore, we'll
17656 ; check for either source or destination offsets being within one
17657 ; sector of the end of their segments and only in that case fall
17658 ; back to a byte move.

17681 ;
17682 ; 16/10/2022
17683 ;
17684 ; check_wrap is a routine that adjusts the starting sector, starting head
17685 ; and starting cylinder for an int 13 request that requests i/o of a lot
17686 ; of sectors. it only does this for fixed disks. it is used in the sections
17687 ; of code that handle ecc errors and dma errors. it is necessary, because
17688 ; ordinarily the rom would take care of wraps around heads and cylinders,
17689 ; but we break down a request when we get an ecc or dma error into several
17690 ; i/o of one or more sectors. in this case, we may already be beyond the
17691 ; number of sectors on a track on the medium, and the request would fail.
17692 ;
17693 ; input conditions:
17694 ; all registers set up for an int 13 request.
17695 ;
17696 ; output:
17697 ; dh - contains starting head number for request
17698 ; cx - contains starting sector and cylinder numbers
17699 ; (the above may or may not have been changed, and are 0-based)
17700 ; all other registers preserved.

19712 ; SYSINIT.TXT (27/01/1983)
19713 ;
19714 ;
19715 ;

```

```

19716 ;-----
19717 ;   SYSINIT is a module linked behind the OEM bios. It takes
19718 ; over the system initialization after the OEM bios has
19719 ; performed any initialization it needs to do. Control is
19720 ; transfered with a long jump to the external variable SYSINIT
19721 ;
19722 ;
19723 ;   The OEM has the following variables declared external:
19724 ;
19725 ;   CURRENT_DOS_LOCATION    WORD
19726 ;
19727 ; This word contains the segment number of the DOS before it
19728 ; is relocated. The OEM bios must set this value.
19729 ;
19730 ;   FINAL_DOS_LOCATION      WORD
19731 ;
19732 ; This word contains the segment number of the DOS after SYSINIT
19733 ; moves it. The OEM bios must set this value.
19734 ;
19735 ;   DEVICE_LIST              DWORD
19736 ;
19737 ; This double word pointer points to the linked list of
19738 ; character and block device drivers. The OEM must set this
19739 ; value.
19740 ;
19741 ;   MEMORY_SIZE              WORD
19742 ;
19743 ; This word contains the number of RAM paragraphs. If the
19744 ; bios doesn't set this variable SYSINIT will automatically
19745 ; calculate it. NOTE: systems with PARITY checked memory must
19746 ; size memory in the BIOS. SYSINITs method is to write memory
19747 ; and read it back until it gets a mismatch.
19748 ;
19749 ;   DEFAULT_DRIVE            BYTE
19750 ;
19751 ; This is the initial default drive when the system first comes
19752 ; up. drive a=0, drive b=1, etc. If the bios doesn't set
19753 ; it then drive a is assumed.
19754 ;
19755 ;   BUFFERS                  BYTE
19756 ;
19757 ; This is the default number of buffers for the system. This
19758 ; value may be overridden by the user in the CONFIG.SYS file.
19759 ; It is DBed to 2 in SYSINIT it should be greater than 1.
19760 ;
19761 ;   FILES                    BYTE
19762 ;
19763 ; This is the default number of files for the system. This
19764 ; value may be overridden by the user in the CONFIG.SYS file.
19765 ; It is DBed to 8 in SYSINIT, values less than 5 are ignored.
19766 ;
19767 ;   SYSINIT                  FAR
19768 ;
19769 ; The entry point of the SYSINIT module. OEM BIOS jumps to
19770 ; this label at the end of its INIT code.
19771 ;
19772 ;   The OEM has the following variables declared public:
19773 ;
19774 ;   RE_INIT                  FAR
19775 ;
19776 ; This is an entry point which allows the BIOS to do some INIT
19777 ; work after the DOS is initialized. ALL REGISTERS MUST BE
19778 ; PRESERVED. On entry DS points to the first available memory
19779 ; (after the DOS). DS:0 points to a 100H byte program header
19780 ; prefix which represents the "program" currently running.
19781 ; This program should be thought of as the OEM BIOS and
19782 ; SYSINIT taken together. This is not a normal program in
19783 ; that no memory is allocated to it, it is running in free
19784 ; memory.
19785 ; NOTES:
19786 ;   At the time this routine is called SYSINIT occupies the
19787 ; highest 10K of memory ("highest" is determined by the value
19788 ; of the MEMORY_SIZE variable), DO NOT DO WRITES THERE.
19789 ;   Since this is called AFTER DOS is initialized, you can
19790 ; make system calls. This also implies that the code for this
19791 ; routine CANNOT be thrown away by use of the
19792 ; FINAL_DOS_LOCATION since the DOS has already been moved.
19793 ;   If you don't want anything done just set this to point
19794 ; at a FAR RET instruction.

20607
20608 ;** CDS - Current Directory Structure
20609 ;
20610 ; CDS items are used by the internal routines to store cluster numbers and
20611 ; network identifiers for each logical name. The ID field is used dually,
20612 ; both as net ID and for a cluster number for local devices. In the case
20613 ; of local devices, the cluster number will be -1 if there is a potential
20614 ; of the disk being changed or if the path must be rechecked.
20615 ;
20616 ; Some pathnames have special preambles, such as
20617 ;
20618 ;     \\machine\sharename\...
20619 ; For these pathnames we can't allow ".." processing to back us
20620 ; up into the special front part of the name. The CURDIR_END field
20621 ; holds the address of the separator character which marks
20622 ; the split between the special preamble and the regular
20623 ; path list; ".." processing isn't allowed to back us up past
20624 ; (i.e., before) CURDIR_END
20625 ; For the root, it points at the leading /. For net
20626 ; assignments it points at the end (nul) of the initial assignment:
20627 ; A:/      \\foo\bar      \\foo\bar\blech\bozo
20628 ;   ^      ^              ^

21039 ;
21040 ; Interrupt level 2, 3, 4, 5, 6, 7, (10, 11, 12, 14, 15 - AT level)
21041 ; should follow the standard Interrupt Sharing Scheme which has
21042 ; a standard header structure.
21043 ; Fyi, the following shows the relations between
21044 ; the interrupt vector and interrupt level.
21045 ;
21046 ; VEC(Hex) 2 8 9 A B C D E 70 72 73 74 76 77
21047 ; LVL(Deci) 9 0 1 2 3 4 5 6 8 10 11 12 14 15
21048 ; MSSTACK module modifies the following interrupt vectors
21049 ; to meet the standard Interrupt Sharing standard;
21050 ; A, B, C, D, E, 72, 73, 74, 76, 77.
21051 ; Also, for interrupt level 7 and 15, the FirstFlag in a standard header
21052 ; should be initialized to indicat whether this interrupt handler is
21053 ; the first (= 80h) or not. The FirstFlag entry of INT77h's
21054 ; program header is initialized in STKINIT.INC module.
21055 ; FirstFlag is only meaningful for interrupt level 7 and 15.
21056 ;
21057 ;
21058 ; User specifies the number of stack elements - default = 9
21059 ; minimum = 8
21060 ; maximum = 64
21061 ;
21062 ; Intercepts Asynchronous Hardware Interrupts only
21063 ;
21064 ; Picks a stack from pool of stacks and switches to it
21065 ;
21066 ; Calls the previously saved interrupt vector after pushing flags
21067 ;
21068 ; On return, returns the stack to the stack pool
21069 ;
21070 ;
21071 ; This is a modification of STACKS:
21072 ; 1. To fix a bug which was causing the program to take up too much space.
21073 ; 2. To dispense stack space from hi-mem first rather than low-mem first.
21074 ; . Clobbers the stack that got too big instead of innocent stack
21075 ; . Allows system to work if the only stack that got too big was the most
21076 ; deeply nested one
21077 ; 3. Disables NMI interrupts while setting the NMI vector.
21078 ; 4. Does not intercept any interrupts on a PCjr.
21079 ; 5. Double checks that a nested interrupt didn't get the same stack.

```

21103
21104 int02:
21105 ; *****
21106 ;
21107 ; this is special support for the pc convertible / nmi handler
21108 ;
21109 ; on the pc convertible, there is a situation where an nmi can be
21110 ; caused by using the "out" instructions to certain ports. when this
21111 ; occurs, the pc convertible hardware *guarantees* that **nothing**
21112 ; can stop the nmi or interfere with getting to the nmi handler. this
21113 ; includes other type of interrupts (hardware and software), and
21114 ; also includes other type of nmi's. when any nmi has occurred,
21115 ; no other interrupt (hardware, software or nmi) can occur until
21116 ; the software takes specific steps to allow further interrupting.
21117 ;
21118 ; for pc convertible, the situation where the nmi is generated by the
21119 ; "out" to a control port requires "fixing-up" and re-attempting. in
21120 ; otherwords, it is actually a "restartable exception". in this
21121 ; case, the software handler must be able to get to the stack in
21122 ; order to figure out what instruction caused the problem, where
21123 ; it was "out"ing to and what value it was "out"ing. therefore,
21124 ; we will not switch stacks in this situation. this situation is
21125 ; detected by interrogating port 62h, and checking for a bit value
21126 ; of 80h. if set, *****do not switch stacks*****.

23191
23192      ; Now, if this is not romdos, we decide what to do with the DOS code.
23193      ; It will either be relocated to low memory, above the DOS data structures,
23194      ; or else it will be located in HiMem, in which case a stub with the DOS
23195      ; code entry points will be located in low memory. Dos_segreinit is used
23196      ; to tell the DOS data where the code has been placed, and to install the
23197      ; low memory stub if necessary. If the DOS is going to go into HiMem, we
23198      ; must first initialize it in its present location and load the installable
23199      ; device drivers. Then, if a HiMem driver has been located, we can actually
23200      ; relocate the DOS code into HiMem.
23201      ;
23202      ; For ROMDOS, if DOS=HIGH is indicated, then we need to call dos_segreinit
23203      ; to install the low memory stub (this must be done before allowing any
23204      ; device drivers to hook interrupt vectors). Otherwise, we don't need to
23205      ; call dos_segreinit at all, since the interrupt vector table has already
23206      ; been patched.

23621
23622 ; es:0 points to block,and bp is the size of the block in para.
23623
23624 ; we will now adjust the size in bp down by the size of sysinit.
23625 ; we need to do this because exec might get upset if some of the exec
23626 ; data in sysinit is overlayed during the exec.
23627
23628             ; 22/10/2022
23629             ; (MSDOS 5.0 IO.SYS SYSINIT:083Bh)
23630 000008C3 8B1E[9402]    mov     bx,[MEMORY_SIZE] ; get location of end of memory
23631 000008C7 8CC8        mov     ax,cs ; get location of beginning of sysinit
23632
23633 ; Note that the "config_wrkseg" environment data is a segment in
23634 ; unallocated memory (as of the Dealloc of [area], above). This is ideal
23635 ; in one sense, because Exec is going to make a copy of it for COMMAND.COM
23636 ; anyway, and no one has responsibility for freeing "config_wrkseg". But
23637 ; we need to make sure that there's no way Exec will stomp on that data
23638 ; before it can copy it, and one way to do that is to make the available
23639 ; memory calculation even more "paranoid", by subtracting "config_wrkseg"
23640 ; from the "memory_size" segment value (which is typically A000h) instead
23641 ; of the current sysinit CS....
23642 ;
23643 ; The reason I use the term "paranoid" is because this code should have
23644 ; slid the data required by Exec up to the very top of memory, because as
23645 ; it stands, you have to have sizeof(COMMAND.COM) PLUS 64K to load just
23646 ; COMMAND.COM (64k is about what sysinit, and all the goop above sysinit,
23647 ; consumes). Now it's just a little worse (65K or more, depending on
23648 ; the size of your CONFIG.SYS, since the size of the environment workspace
23649 ; is determined by the size of CONFIG.SYS.... -JTP

; BUGBUG - we don't update confbot - won't someone else use it?
; chunkst -- answer: no. Confbot is used to access the CDSs,
; 25 Jul 92 which are stored BELOW it. Alloclim is the
; variable which has the top of free memory for
; device driver loads, etc.

    sub     si,ax

; chunkst, 25 Jul 92 -- note: I'm removing the code here
; that automatically updates alloclim every time we
; set up some new CDSS. Instead, I've added code
; which pre-allocates space for 26 CDSS. This
; way we've got room for worst case CDSS before
; we place MagicDrv.sys

    mov     [ALLOCLIM],si ; can't alloc past here!

26984 ; -----
26985 ; 27/03/2019 - Retro DOS v4.0
26986
26987 ; -----
26988 ; ibmstack initialization routine.
26989 ;
26990 ; to follow the standard interrupt sharing scheme, msstack.asm
26991 ; has been modified. this initialization routine also has to
26992 ; be modified because for the interrupt level 7 and 15, firstflag
26993 ; should be set to signal that this interrupt handler is the
26994 ; first handler hooked to this interrupt vector.
26995 ; we determine this by looking at the instruction pointed by
26996 ; this vector. if it is iret, then this handler should be the
26997 ; first one. in our case, only the interrupt vector 77h is the
26998 ; interrupt level 15. (we don't hook interrupt level 7.)
26999 ;
27000 ; the followings are mainly due to m.r.t; ptm fix of p886 12/3/86
27001 ; some design changes are needed to the above interrupt sharing
27002 ; method. the above sharing scheme assumes that 1). interrupt
27003 ; sharing is never done on levels that have bios support. 2). "phantom"
27004 ; interrupts would only be generated on levels 7 and 15.
27005 ; these assumptions are not true any more. we have to use the firstflag
27006 ; for every level of interrupt. we will set the firstflag on the following
27007 ; conditions:
27008 ;
27009 ; a. if the cs portion of the vector is 0000, then "first"
27010 ; b. else if cs:ip points to valid shared header, then not "first"
27011 ; c. else if cs:ip points to an iret, then "first"
27012 ; d. else if cs:ip points to dummy, then "first"
27013 ;
27014 ; where dummy is - the cs portion must be f000, and the ip portion must
27015 ; be equal to the value at f000:ff01. this location is the initial value
27016 ; from vector table for interrupt 7, one of the preserved addresses in all
27017 ; the bioses for all of the machines.

```

```

27018 ;
27019 ; system design group requests bios to handle the phantom interrupts.
27020 ;
27021 ; the "phantom" interrupt is an illegal interrupt such as an interrupt
27022 ; produced by the bogus adapter card even without interrupt request is
27023 ; set. more specifically, 1). the 8259 has a feature when running in
27024 ; edge triggered mode to latch a pulse and present the interrupt when
27025 ; the processor indicates interrupt acknowledge (inta). the interrupt
27026 ; pulse was exist at the time of inta to get a "phantom" interrupt.
27027 ; 2). or, this is caused by adapter cards placing a glitch on the
27028 ; interrupt line.
27029 ;
27030 ; to handle those "phantom" interrupts, the main stack code will check
27031 ; the own firstflag, and if it is not "first" (which means the forward
27032 ; pointer points to the legal shared interrupt handler), then pass the
27033 ; control. if it is the first, then the following action should be
27034 ; taken. we don't have to implement skack logic in this case.
27035 ;
27036 ; to implement this logic, we rather choose a simple method.
27037 ; if ont of the above "firstflag" conditions is met, we are not
27038 ; going to hook this interrupt vector. the reason is if the original
27039 ; vector points to "iret" and do nothing, we don't need
27040 ; to implement the stack logic for it. this will simplify implementation
27041 ; while maintaining compatibility with the old version of dos.
27042 ; this implies that in the main stack code, there might be a stack code
27043 ; that will never be used, a dead code.
27044 ;

28761 ; (tm10) ; 0020H=colon is not necessary for switch
28762 ; DW RESULT ; RESULT BUFFER
28763 ; DW VALUES ; VALUE LISTS
28764 ; DB nld ; NUMBER OF KEYWORD/SWITCH SYNONYMS IN FOLLOWING LIST
28765 ; DB "...",0 ; IF n > 0, KEYWORD 1
28766 ;
28767 ;
28768 ; Note:
28769 ; - The MATCH_FLAG is bit significant. You can set, for example, TIME bit and
28770 ; DATE bit simalteniously.
28771 ;
28772 ; The parser examines each bit along with the following priority.
28773 ;
28774 ; COMPLEX -> DATE -> TIME -> NUMERIC VAL -> SIGNED NUMERIC VAL -> DRIVE ->
28775 ; FILE SPEC -> SIMPLE STRING.
28776 ;
28777 ; - When the FUNCTION_FLAG is 0001 or 0002, the STRING pointed to by a pointer
28778 ; in the result buffer is capitalized.
28779 ;
28780 ; - Match_Flags 0001H and 0002H have meaning only for the positional.
28781 ;
28782 ; - The "...",0 (bottom most line) does require '=' or '/'. When you need a
28783 ; switch, for example, '/A', then STRING points to;
28784 ;
28785 ; DB 1 ; number of following synonyms
28786 ; DB '/A',0
28787 ;
28788 ; when you need a keyword, for example, 'CODEPAGE=', then "...",0 will be;
28789 ;
28790 ; DB 1 ; number of following synonyms
28791 ; DB 'CODEPAGE=',0
28792 ;
28793 ; - "...",0 must consist of upper case characters only because the parser
28794 ; performs pattern matching after converting input to upper case (by
28795 ; using the current country upper case table)
28796 ;
28797 ; - One "...",0 can contain only one switch or keyword. If you need, for
28798 ; example /A and /B, the format will be;
28799 ;
28800 ; DB 2 ; number of following synonyms

29117
29118      ; 7/28/87 : Kerry S (;AN018;)
29119      ; Non optional value on switch (match flags<>0 and <>1) not flagged
29120      ; as an error when missing. Solution: return error 2. Modules
29121      ; affected: _$P_Chk_SW_Control.
29122
29123      ; 7/29/87 : Kerry S (;AN019;)

```

```

29124 ; Now allow the optional bit in match flags for switches. This
29125 ; allows the switch to be encountered with a value or without a
29126 ; value and no error is returned.
29127 ;
29128 ;
29129 ; 8/28/87 : Ed K, Kerry S (;AN020;)
29130 ; 9/14/87 In PROC _$P_Get_DecNum, when checking for field separators
29131 ; within a date response, instead of checking just for the one
29132 ; character defined by the COUNTRY DEPENDENT INFO, check for
29133 ; all three chars, "-", "/", and ".". Change _$P_Chk_Switch to allow
29134 ; slashes in date strings when DateSw (assembler switch) is set.
29135 ;
29136 ; 9/1/87 : Kerry S (;AN021;)
29137 ; In PROC _$P_String_Comp, when comparing the switch or keyword on
29138 ; the command line with the string in the control block the
29139 ; comparing was stopping at a colon (switch) or equal (keyword)
29140 ; on the command line and assuming a match. This allowed a shorter
29141 ; string on the command line than in the synonym list in the control
29142 ; block. I put in a test for a null in the control block so the
29143 ; string in the control block must be the same length as the string
29144 ; preceding the colon or equal on the command line.
29145 ;
29146 ; 8/28/87 : Kerry S (;AN022;)
29147 ; All references to data in PSDATA.INC had CS overrides. This caused
29148 ; problems for people who included it themselves in a segment other
29149 ; than CS. Added switch to allow including PSDATA.INC in any
29150 ; segment.
29151 ;
29152 ; 9/16/87 : Ed K (;AN023;) PTM1040
29153 ; in _$P_set_cdi PROC, it assumes CS points to psdata. Change Push CS
29154 ; into PUSH CS. In _$P_Get_DecNum PROC, fix AN020
29155 ; forced both TIME and DATE to use the delims, "-", "/", ".".
29156 ; Created FLAG, in _$P_time_Format PROC, to request the delim in
29157 ; BL be used if TIME is being parsed.
29158 ;
29159 ; 9/24/87 : Ed K
29160 ; Removed the include to STRUC.INC. Replaced the STRUC macro
29161 ; invocations with their normally expanded code; made comments
29162 ; out of the STRUC macro invocation statements to maintain readability.
29163 ;
29164 ; 9/24/87 : Ed K (;AN024;) PTM1222
29165 ; When no CONTROL for a keyword found, tried to fill in RESULT
29166 ; pointed to by non-existent CONTROL.
29167 ;
29168 ; 10/15/87 : Ed K (;AN025;) PTM1672
29169 ; A quoted text string can be framed only by double quote. Remove
29170 ; support to frame quoted text string with single quote.
29171 ; (apostrophe) _$P_Sord_Quote is removed from PSDATA.INC.
29172 ; _$P_SQuote EQU also removed from PSDATA.INC. Any references to
29173 ; single quote in PROC prologues are left as is for history reasons.
29174 ;
29175 ; This fixes another bug, not mentioned in p1672, in that two
29176 ; quote chars within a quoted string is supposed to be reported as
29177 ; one quote character, but is reported as two quotes. This changed
29178 ; two instructions in PROC _$P_Quoted_Str.
29179 ;
29180 ; Also fixed are several JMP that caused a NOP, these changed to
29181 ; have the SHORT operator to avoid the unneeded NOP.
29182 ;
29183 ; The code and PSDATA.INC have been aligned for ease of reading.
29184 ;
29185 ; 10/26/87 : Ed K (;AN026;) PTM2041, DATE within SWITCH, BX reference to
29186 ; psdata buffer should have cs.
29187 ;
29188 ; 10/27/87 : Ed K (;AN027;) PTM2042 comma between keywords implies
29189 ; positional missing.
29190 ;
29191 ; 11/06/87 : Ed K (;AN028;) PTM 2315 Parser should not use line feed
29192 ; as a line delimiter, should use carriage return.
29193 ; Define switch: LFEOLSW, if on, accept LF as end of line char.
29194 ;
29195 ; 11/11/87 : Ed K (;AN029;) PTM 1651 GET RID OF WHITESPACE AROUND "=".
29196 ;
29197 ; 11/18/87 : Ed K (;AN030;) PTM 2551 If filename is just "", then
29198 ; endless loop since SI is returned still pointing to start
29199 ; of that parm.
29200 ;
29201 ; 11/19/87 : Ed K (;AN031;) PTM 2585 date & time getting bad values.
29202 ; Vector to returned string has CS instead of cs, but
29203 ; when tried to fix it on previous version, changed similar
29204 ; but wrong place.
29205 ;
29206 ; 12/09/87 : Bill L (;AN032;) PTM 2772 colon and period are now valid
29207 ; delimiters between hours, minutes, seconds for time. And period
29208 ; and comma are valid delimiters between seconds and 100th second.
29209 ;
29210 ; 12/14/87 : Bill L (;AN033;) PTM 2722 if illegal delimiter characters
29211 ; in a filespec, then flag an error.
29212 ;
29213 ; 12/22/87 : Bill L (;AN034;) All local data to parser is now
29214 ; indexed off of the cs equate instead of the DS register.
29215 ; Using this method, DS can point to the segment of PSP or to psdata
29216 ; --> local parser data. Why were some references to local data changed
29217 ; to do this before, but not all ???

32015                                ; There are two primary definitions which need to be made, selectively, before
32016                                ; this include file should be used. These are:
32017                                ; HV_Extern - If this has been defined, variables for this module will be
32018                                ; declared as external. Otherwise, variables will be declared
32019                                ; public, as well as defined, here. LoadHigh declares HV_Extern
32020                                ; in stub.asm and loadhi.asm, and does not declare it in
32021                                ; rdata.asm... DeviceHigh does not declare HV_Extern anywhere
32022                                ; (as only one module, sysconf.asm, includes this file).
32023                                ; HV_LoadHigh - This should be defined when this module is going into
32024                                ; command.com, for LoadHigh. All of loadhi.asm, stub.asm and
32025                                ; rdata.asm define this, while io.sys' sysconf.asm does not.
32026                                ;
32027                                ;*****
32028                                ;
32029                                ; To keep track of which UMBs were specified on the DH/LH command lines, and
32030                                ; to keep track of the minimum sizes given for each, there're two arrays kept
32031                                ; in { IO.SYS: sysinitseg / COMMAND.COM: DATARES }... each is MAXUMB elements
32032                                ; big. 16 should be around 14 too many for most users, so there's no expected
32033                                ; space problem (it's just such a nice round number, eh?).
32034
32035                                MAXUMB      equ      16
32036
32037                                ; Memory elements owned by the system are marked as PSP address 8 in both the
32038                                ; USA and Japan; Japanese systems also use 9 under more bizzarre conditions.
32039
32040                                FreePSPowner      equ      0          ; Free MCBs all have an owner PSP address of 0
32041                                SystemPSPowner     equ      8
32042                                ;JapanPSPowner      equ      9
32043
32044                                ; for LoadHigh and DeviceHigh:
32045                                ;
32046                                ; fInHigh - Is set to 1 during HideUMBs(), and back to zero in
32047                                ; UnHideUMBs().
32048                                ; fUmbTiny - Is set to 1 iff the user has specified /S on the command-
32049                                ; line.
32050                                ; SegLoad - Segment address for first UMB specified; set automatically.
32051                                ; UmbLoad - The load UMB number; for example, this is 3 if the user has
32052                                ; given a command-line like "/L:3,500;4"
32053                                ; Umbused - An array of characters, each of which is 1 iff the UMB
32054                                ; matching its index number was specified on the command-line;
32055                                ; for example, after "/L:3,500;4;7", Umbused[3], [4] and [7]
32056                                ; will be set to 1. All others will be set to 0.
32057                                ; UmbSize - An array of words, each of which is interpreted as a size
32058                                ; specified by the user for a UMB (in the above example, all
32059                                ; elements would be zero save UmbSize[3], which would be 500.
32060                                ; fm_umb - Set to the old UMB link-state (0x80 or 0x00)
32061                                ; fm_strat - Set to the old memory-allocation strategy (0$00000???)
32062                                ; fm_argc - Number of arguments received by ParseVar() (see ParseVar()
32063                                ; for details).

32396          ;
32397          ; HACK: when 4DOS.COM is the shell and it doesn't have an environment from
32398          ; which to obtain its original program name, it grovels through all of
32399          ; memory to find the filename that was used to exec it; it wants to find
32400          ; the SHELL= line in the in-memory copy of CONFIG.SYS, and it knows that
32401          ; sysinit converts the SHELL= keyword to an 'S', so it expects to find an 'S'
32402          ; immediately before the filename, but since we are now storing line # info
32403          ; in the config.sys memory image, 4DOS fails to find the 'S' in the right
32404          ; spot.
32405          ;
32406          ; So, on the final pass of CONFIG.SYS, copy the command code (eg, 'S')
32407          ; over the line number info, since we no longer need that info anyway. This
32408          ; relies on the fact that getchr leaves ES:SI pointing to the last byte

35809 ; HIGHLOAD.INC (MSDOS 6.0 - 1991)
35810 ; -----
35811 ; 07/04/2019 - Retro DOS v4.0
35812 ; -----
35813 ; *****
35814 ;
35815 ; This file contains routines needed to parse and implement user-given
35816 ; command-line options of the form "/S:L:3,0x500;2;7,127;0x0BE4". InitVar()
35817 ; and Parsevar() are used to parse this data and place it in encoded form into
35818 ; the variables in highvar.inc, for use by the rest of the routines.
35819 ;
35820 ; DeviceHigh accepts this command-line (handled in sysconf.asm, not here):
35821 ;   DEVICEHIGH SIZE=hhhhh module opts
35822 ; Or, DeviceHigh and LoadHigh accept any of the following:
35823 ;   DH/LH module opts
35824 ;   DH/LH [/S][/L:umb[,size][;umb[,size]]*] module opts
35825 ;   DH/LH [/L:umb[,size][;umb[,size]]*][/S] module opts
35826 ; The initial UMB,SIZE pair designates the module's load address; the remainder
35827 ; of the UMB and SIZE pairs are used to indicate specific UMBs to be left
35828 ; available during the load.
35829 ;
35830 ; When an actual load is ready to be performed, a call to HideUMBs() will
35831 ; temporarily allocate (as owner 8+"HIDDEN ") all free elements in any
35832 ; upper-memory block which was not specified by the user... in addition, if
35833 ; UMBs were marked to shrink (/S option) to a certain size ("umb,size"), any
35834 ; elements in that umb SAVE the lower-half of the newly-shrunk one are also
35835 ; allocated. After the load, the function UnHideUMBs() (in highexit.inc) will
35836 ; free any UMBs so allocated.
35837 ;
35838 ; When a device driver loads, there is the additional problem of allocating its
35839 ; initial load site; this should be restricted to the first UMB specified on
35840 ; the command-line. The function FreezeUM temporarily allocates all remaining
35841 ; free upper-memory elements (as owner 8+"FROZEN "), except those in the load
35842 ; UMB. Then the initial allocation may be made, and a call to UnFreeze will
35843 ; return any so-allocated memory elements to FREE, for the true load. Note
35844 ; that UnFreeze leaves HIDDEN elements allocated; it only frees FROZEN ones.

36072
36073 ; 08/04/2019 - Retro DOS v4.0
36074
36075 ;-----
36076 ;** ParseVar - parses [/S][/L:umb[,size][;umb[,size]]*] and builds the table
36077 ; laid out in highvar.inc
36078 ;-----
36079 ; ENTRY: ES:SI points to command tail of LoadHigh/DeviceHigh (whitespace ok)
36080 ; EXIT: ES:SI points to first character in child program name
36081 ; ERROR: ES:SI points to character which caused error, carry set, AX == code
36082 ; USES: ES:SI, AX, flags, variables in highvar.inc
36083 ;-----
36084 ; Error codes (in AX if carry set on return):
36085 ;
36086 PV_InvArg equ 1 ; Invalid argument passed
36087 PV_BadUMB equ 2 ; Bad UMB number passed (duplicate?)
36088 PV_InvSwT equ 3 ; Unrecognized switch passed
36089 ;
36090 ; This routine expects ES:SI to point to a string much like the following:
36091 ; "/S/L:1,200;2 module options"
36092 ; Optionally, the string can begin with whitespace; neither /S nor /L is
36093 ; required, though that's what this routine is supposed to parse.
36094 ;
36095 optS equ 'S' ; /S
36096 optL equ 'L' ; /L:...
36097 ;
36098 ;-----
36099 ; LoadHigh has a list of arguments, returned by cparse, which is used to create
36100 ; a command-line for spawning a child process. For a typical LH command, say,
36101 ; lh /l:1,1000;2 print/d:1pt2
36102 ; the arguments would look like (one per line):
36103 ; lh
36104 ; /l
36105 ; 1
36106 ; 1000
36107 ; 2
36108 ; print
36109 ; /d
36110 ; :1pt2
36111 ; In short, if "print" were, say, "43", there'd be no way to determine which
36112 ; arg was the filename. So, inside this routine, we keep a running counter
36113 ; of the number of arguments LH will need to skip in order to get to the
36114 ; program name. The "lh" is implicit--it'll always have to skip that. So if
36115 ; there's no "/l" or "/s", fm_argc will be 0 ... other than that, 1 is added
36116 ; for:
36117 ; Each /L
36118 ; Each /S (there should be only one)
36119 ; Each UMB number (they follow ":" or ";")
36120 ; Each UMB size (they follow ",")
36121 ; So, in the above example, fm_argc would be 4-- and LH would skip right to
36122 ; "print". Note that InitVar initializes fm_argc to zero.

39906 ; 14/04/2019 - Retro DOS v4.0
39907
39908 ; Multiple configuration block support Created 16-Mar-1992 by JeffPar
39909 ;
39910 ; Summary:
39911 ;
39912 ; The procedure "organize" crunches the in-memory copy of config.sys
39913 ; into lines delimited by CR/LF (sometimes no CR, but *always* an LF)
39914 ; with the leading "keyword=" replaced by single character codes (eg, B
39915 ; for BUFFERS, D for DEVICE, Z for any unrecognized keyword); see comtab
39916 ; and/or config.inc for the full list.
39917 ;
39918 ; [blockname] and INCLUDE are the major syntactical additions for multi-
39919 ; configuration support. blockname is either MENU, which contains one
39920 ; or more MENUITEM lines, an optional MENUDEFAULT (which includes optional
39921 ; time-out), or any user-defined keyword, such as NETWORK, CD-ROM, etc.
39922 ; INCLUDE allows the current block to name another block for inclusion
39923 ; during the processing phase of CONFIG.SYS. An INCLUDE is only honored
39924 ; once, precluding nasty infinite-loop scenarios. If blocks are present
39925 ; without a MENU block, then only lines inside COMMON blocks are processed.
39926 ;
39927 ; Example:
39928 ;
39929 ; [menu]
39930 ; menuitem=misc,Miscellaneous
39931 ; menuitem=network,Network Configuration
39932 ; menudefault=network,15
39933 ;
39934 ; [network]
39935 ; include misc
39936 ; device=foo
39937 ;
39938 ; [misc]
39939 ; device=bar
39940 ; include alternate
39941 ;
39942 ; [alternate]
39943 ; device=tar
39944 ;
39945 ;
39946 ; when the menu is displayed
39947 ;
39948 ; 1. Miscellaneous
39949 ; 2. Network Configuration
39950 ;
39951 ; #2 is highlighted as the default option, and will be automatically
39952 ; selected after 15 seconds. It will invoke the following lines in the
39953 ; following order:
39954 ;
39955 ;     DEVICE=BAR
39956 ;     DEVICE=TAR
39957 ;     DEVICE=FOO
39958 ;
39959 ;
39960 ;MULTI_CONFIG equ 1
39961 ;
39962 ; the following depend on the positions of the various letters in switchlist
39963 ;
39964 switchnum equ 11111000b ; 0F8h ; which switches require number
39965 ;
39966 flagec35 equ 00000100b ; 4 ; electrically compatible 3.5 inch disk drive
39967 flagdrive equ 00001000b ; 8
39968 flagcyln equ 00010000b ; 16
39969 flagseclim equ 00100000b ; 32
39970 flagheads equ 01000000b ; 64
39971 flagff equ 10000000b ; 128
